Top 10 Reasons You Need Digital Quality Management

You have too much scrap, waste, or giveaway

- It can be challenging to pinpoint where the worst process variation is occurring

- Digital quality tools, such as InfinityQS Enact, help you evaluate potential vs. expected yield—across processes, lines, and plants—so you can prioritize improvement efforts

1

Your operators are overwhelmed

- Operators often struggle to complete tasks; a quality system that streamlines workload and improves job satisfaction would help

- Digital quality solutions have dashboards, customized work instructions, and data collection reminders that improve operator efficiency and accountability

2

You have limited visibility into process performance

- You want to better understand performance, but it is difficult to access data across processes, lines, and plants with your current system

- Going digital means you can compare all your quality data—so you can quickly compare performance and see the "big picture"

3

You don't get real-time event notifications

- Real-time notifications are critical "must haves"
- Enact sends event notifications automatically—to operators and quality staff, as well as to supervisors and managers—keeping everyone informed

4

You can't quickly generate reports for auditors or customers

- It is very time consuming to wade through piles of irrelevant, out-of-date, static data
- Enact's digital, real-time dashboards can be specifically tailored to match each role—enabling you to quickly respond to external data requests with accurate information

5

You still use pencil and paper on your plant floor

- Manual record keeping is error prone, re-keying data is expensive, and information is often incomplete and hard to share
- Enact automatically collects and shares real-time data with stakeholders—across all your plants

6

You need to improve accountability

- Is your team completing quality checks on time? Are your products and processes in compliance?
- Enact records which operator captured quality data—and when they did so—to help keep everyone accountable
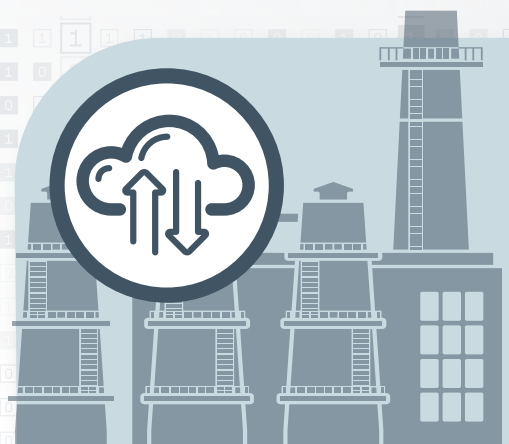

7

You lack data traceability

- You want a quality system that collects quality and process data to help improve traceability
- Enact records part, process, lot, and shift, and can include special data tags for enhanced traceability

8

You still use home-grown systems

- Improving and supporting IT systems is time-consuming and expensive—and not sustainable
- Cloud-based, digital tools are regularly updated and enhanced, and can be tailored to your manufacturing environment—minimizing configuration and maintenance needs

9

Your IT staff is overwhelmed

- Many quality systems require knowledge of your network, databases, software installation, device selection, etc.—but your IT team is too busy
- Because Enact lives in the cloud, it is easy to deploy and manage—you only need an internet connection and a web browser
